SUMMARY

ECE graduate with hands-on DevOps project experience across the full deployment lifecycle — containerizing applications with Docker, automating builds with GitHub Actions CI/CD, deploying to Kubernetes with Helm, and publishing live on Render and Vercel. Comfortable working in Linux environments, writing automation scripts, and debugging deployment pipelines end-to-end. Looking to contribute as a junior DevOps or cloud engineer and grow fast in a team environment.

TECHNICAL SKILLS

DevOps & CI/CD: Docker, GitHub Actions, Docker Hub, Helm, Render, Vercel, Webhook-triggered deployments

Container Orchestration: Kubernetes (Deployments, Services, Ingress), Minikube, self-healing workloads

Cloud: AWS EC2 (instance setup, SSH, security groups), basic cloud architecture

Scripting & Automation: Bash (log monitoring, task automation)

Operating Systems: Linux (Ubuntu) — file system, permissions, process management, cron

Networking: IP addressing, ports, subnetting, HTTP basics, DNS/hosts resolution

Other: Git, GitHub, YAML, Python (Flask), React, VS Code

PROJECTS

DevOps Portfolio Website | *React, Docker, Kubernetes, Helm, GitHub Actions* [GitHub] [Live]

- Built a personal portfolio site with React and Vite, containerized via a multi-stage Dockerfile producing a 20MB nginx-served production image
- Automated image builds and Docker Hub publishing with a GitHub Actions CI workflow triggered on every push to main
- Deployed the application to Kubernetes using Deployment, Service, and Ingress resources; verified self-healing by manually terminating pods and observing automatic replacement with zero downtime
- Migrated raw Kubernetes manifests into a templated Helm chart, parameterizing image tag, replica count, and ingress host via values.yaml; used `helm upgrade` to scale replicas without editing YAML
- Debugged real cross-platform networking issues (WSL2 network namespaces, Windows hosts file, DNS resolution) to expose the cluster via Ingress on a local hostname
- *Actively extending this project to provision infrastructure with Terraform on AWS EKS, adopt GitOps deployment via ArgoCD, and add Prometheus/Grafana monitoring*

Live DevOps App — CI/CD Pipeline with Docker & GitHub Actions | GitHub Live Demo

- Built and deployed a Python Flask Task Manager app publicly accessible with zero downtime and auto-redeploy on every push
- Containerized the application using a custom Dockerfile, packaging all dependencies into a portable image pushed to Docker Hub
- Designed a full CI/CD pipeline using GitHub Actions — every git push automatically builds, pushes to Docker Hub, and triggers a live redeploy on Render
- Diagnosed and fixed real pipeline failures — broken build contexts, missing secrets, and permission errors — by reading CI logs and iterating on the workflow

Linux Log Monitoring & Alerting System | GitHub

- Wrote Bash scripts to continuously monitor `/var/log/syslog` in real time using `tail -f` and `grep`, automatically flagging error patterns
- Automated scheduled log checks using `cron`, reducing time-to-detect simulated system errors — skills applicable to SRE and DevOps roles

EXPERIENCE

RFQ Analyst

Mar 2025 – Mar 2026

SFO Technologies

- Applied process automation thinking to eliminate repetitive manual tasks, reducing turnaround time on internal workflows
- Performed systematic data validation across procurement records, catching inconsistencies before escalation
- Coordinated with cross-functional teams to resolve data and process bottlenecks under deadline pressure
- Demonstrated ability to work in a professional environment, manage deliverables, and adapt to changing requirements

EDUCATION

Jyothi Engineering College

2020 – 2024

B.Tech in Electronics and Communication Engineering

CGPA: 7.0
